Introduction & Motivation

- Build an embedded system in a microcontroller with a trained Neural Network, using TinyML.
- Use of low code or no code platform.
- Program a neural network on low power microcontroller.

Safe Physical Exercise

Identify the correctness of fitness exercises to avoid injury.

Embedded Systems

Autonomous, low-power, small size

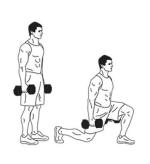

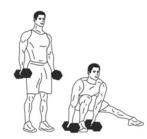

Real time feedback

Sensors in gym equipment to provide feedback.

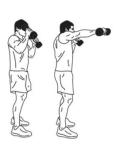

Objectives

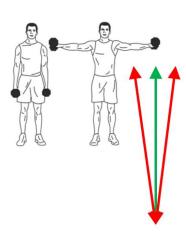

- **Autonomy** Operate autonomously with a battery for more than 8h.
- **Compact Design** Compact and lightweight facilitating ease of use during exercise and to be attached to gym equipment.
- Real-time Data Acquisition Capability to collect motion data using accelerometer data in real-time and communicate to a host device using BLE.
- **Training NN** Train a NN model with a custom dataset for different exercise movements and with correct and incorrect labels.
- Classification validate the movement via a trained NN.
- **Feedback** provide real-time feedback to the user.

Related Works on Movement Recognition

Neural Networks for classification and movement recognition. Works were investigated in multiple areas such as:

Neural Networks applied to Sports

Wearable sensors to detect moves, using the IMU signal processing methods to classify specific activities. Examples like: jump frequency in volleyball, putt in golf, activity recognition in beach volleyball using a Deep Convolutional Neural Network - used also to avoid injuries, etc

Neural Networks applied to Health

The use of MCUs as edge inference devices for healthcare wearables, emphasize the need of TinyML solutions.

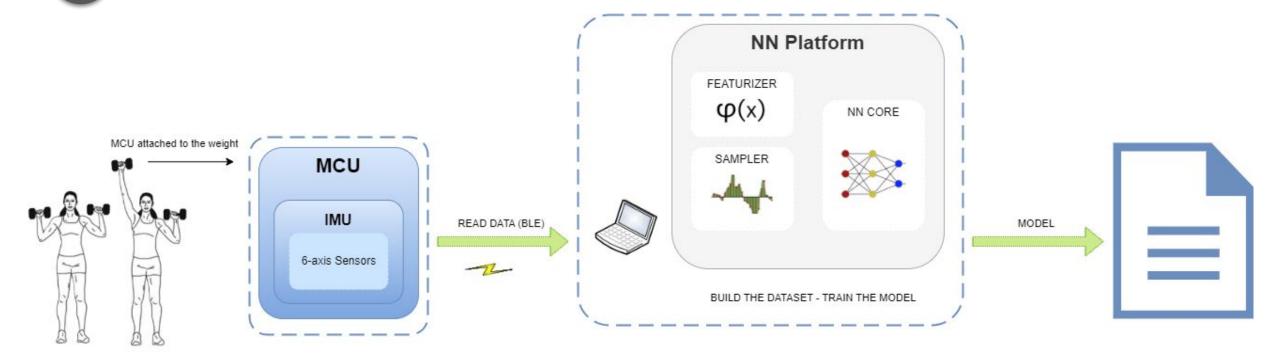

Generic Features

Use classification based on a set of generic features that were calculated from the sensor data to determine movements recognition.

Solution Outline

Solution Outline

Platforms

Edge

Impulse

- · No code platform.
- No cost.
- Integrates with small portable MCUs.
- Uses TensorFlow Lite for training, optimizing, and deploying deep learning models to embedded devices.

- · Development platform.
- No cost.

- Google Colab
- Designed to run ML models on MCUs and other devices with only few kilobytes of memory.
- TensorFlow Lite can be use.

Relevant Technologies on Movement Recognition

01

Accelerometer & Gyroscope

Acc detects linear acceleration of devices, that is, the acceleration along an axis. While gyro detects the angular velocity, i.e, how fast the body is turning.

02

Ultra Low Power Embedded System

Capture, measure and report acceleration, orientation and other gravitational forces.

03

Bluetooth Low Energy

Wireless, low-power personal area network. Its goal is to connect devices over a relatively short range.

                    samplesRead = 0:
                    break:
                // check if the all the required samples have been read since
                // the last time the significant motion was detected
                while (samplesRead < numSamples) {</pre>
                 // check if both new acceleration and gyroscope data is
                  // available
                  // read the acceleration and gyroscope data
```

Ultra Low Power Embedded System

3 4 3 4 3 4 5 5 5 5 6 7 7 8 9 10 1	NRF51 Sensor Tag	Seeed Studio XIAO nRF52840 Sense	CJMCU Beetle	Texas Instruments TIDC-CC2650ST K-SENSORTAG			
Advantages	Low cost, 3 axis Accelerometer Sensor, BLE 5.0, Low Power Consumption Bluetooth.	Low cost, Low Power, BLE 5, Great documentation, not expensive, easy to start use and program, IMU with extra capabilities - like pedometer.	Low-power and extended-range Capabilities.	Advanced debugging and profiling Tools. Excluded due to the size, price and the learning curve of the software use to Develop.			
Disadvantages	Excluded due to the lack of examples and public documentation.	Pay more for the connectivity	Doesn't have built-in Bluetooth capabilities.				

Preliminary Results

01

Pedometer experience

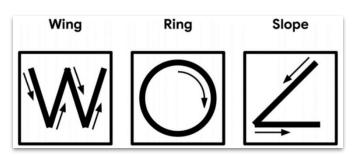

Step counter, collecting the data from the sensor.

02

Magic Wand – Tiny ML

The goal was to analyze the 3-axis returns in different movements

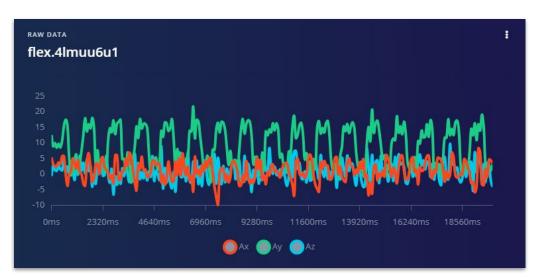

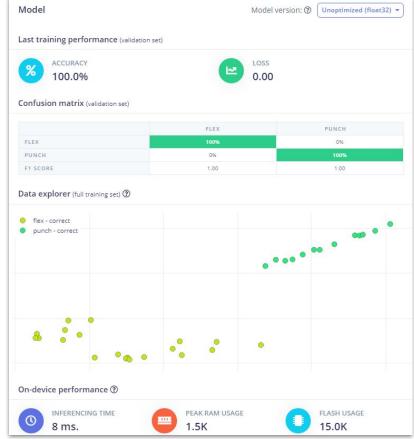

Preliminary Results

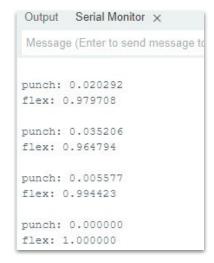

Evaluation of TensorFlow Lite using the Edge Impulse Platform

The NN was trained using Edge impulse and the model was uploaded to the MCU using TensorFlow Lite (in Arduino).

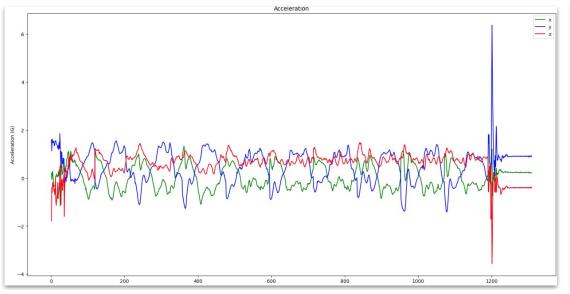

Preliminary Results

Evaluation of TensorFlow Lite Using the Google Colab Platform

The NN was trained using a notebook (python code) in Google Colab and the model was included in the MCU using TensorFlow Lite.

```
    Build & Train the Model

Build and train a TensorFlow model using the high-level Keras API.
   # build the model and train it
    model = tf.keras.Sequential()
    model.add(tf.keras.layers.Dense(50, activation='relu')) # relu is used for performance
    model.add(tf.keras.layers.Dense(15, activation='relu'))
    model.add(tf.keras.layers.Dense(NUM GESTURES, activation='softmax')) # softmax is used, because we only expect one gesture to occur per input
    model.compile(optimizer='rmsprop', loss='mse', metrics=['mae'])
   history = model.fit(inputs train, outputs train, epochs=600, batch size=1, validation data=(inputs validate, outputs validate))
   Epoch 170/600
    13/13 [============] - 0s 6ms/step - loss: 0.0010 - mae: 0.0236 - val loss: 1.2282e-04 - val mae: 0.0081

Work Plan

	Sep	Oct	Nov	Dec	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep
First Phase													
References and State of the art investigation													
Compare, test and choose the microcontroller													
Brief investigation on Neural Networks													
Design a first proposal of architecture													
Write Report													
Second Phase													
Neural Network experiments													
Collect data													
Train Model													
Test Model													
Optimize Model									4				
Write Final Report													
						Here							

Challenges and Limitations

Challenges

Program a NN to run on the selected MCU

Optimize the construction of the Model due to the limitations

Improve battery usage

Limitations

Ability of optimize the results of the NN Platforms used

Limited Storage

Limited RAM

Conclusions

When I accepted this challenge the first step was to analyze the state of the art and existing solutions and how I was going to compose my own. A preliminary evaluation of the solution was found and explored.

Next Steps:

- Improve the collect of the data.
- Improve the Training of the NN.
- Optimization of the network using TinyML (TensorFlow).

THANK YOU!
